

# COMMITMENT TO SUSTAINABLE WINEMAKING

Bleasdale's viticulture programme promotes a sustainable approach to vineyard management which makes best use of natural resources while advancing environmental health and safety for all stakeholders including vineyard staff, neighbouring properties, and wine consumers. The holistic nature of this approach promotes sustainable production of high quality wine grapes with minimal reliance on pesticides and other synthetic inputs.

By adopting this approach, Bleasdale has been able to remove synthetic insecticides from our practices and the introduction of organic nutrients such as seaweed and animal manures has helped to strengthen vines against insect and fungal attack. The benefits of this program on biodiversity and environmental health continue to improve as our knowledge evolves and practices also improve.
